INDIRECT POTABLE REUSE IN SOUTHERN CALIFORNIA: CASE STUDIES

Thomas McCarthy*

ABSTRACT: Between drought, environmental constraints, and in some places dwindling groundwater supplies, water supply reliability is a significant concern in California. Reliable water supplies are required for drinking, sanitation, and economic development. Indirect potable reuse is a method to reuse the resources we have and increase reliability of supply. This presentation will present case studies from Southern California where agencies are indirectly using treated wastewater as a potable supply. The presentation will present show how these projects are being completed from a regulatory and economic perspective.
